TITLE: External insulating material for internal
combustion
engine components - has flat friction-absorbent
material
on inside of casing at decreasing distance from
component
outside surface

INVENTOR: WIRTH, A

PATENT-ASSIGNEE: ETIS AG[ETISN]

PRIORITY-DATA: 1996CH-0001543 (June 20, 1996)

ABSTRACTED-PUB-NO: EP 906539B

BASIC-ABSTRACT:

The insulating material is arranged in casing sections (1,2) joined together,
each being made of glass-fibre with inner and outer skins (7,5) and containing
laminated insulating material (14), also rib-type supporting portions (10,11)
at two or more edges. The casing sections each have a flat friction-absorbent
layer at the side towards the component and joined to the inner skin.

The layer (12,13) runs along smooth outside surfaces of the

component and at a decreasing distance from them, absorbing over its surface the vibration-generated friction between the component and the casing sections.

This layer can be made of chrome steel in wire-mesh or sheet-metal form, being secured by glass-fibres to the inner skin and roller-welding to sheet-metal.

USE - Particularly for thermal and acoustic insulation of turbochargers and exhaust systems of high-speed diesel engines.

ADVANTAGE - Adaptability, easy installation and removal, and long life.
